

SKF Vibracon

The economical machinery mounting solution

Why use SKF Vibracon?

- SKF Vibracon is a self leveling, height adjustable and re-usable chock.
- Easy and accurate mounting of all types of rotating equipment to base frames, steel foundations or concrete.
- Eliminates soft foot.
- Reduces the cost of equipment foundations by design for the first build or through retrofit.
- SKF Vibracon has many well documented applications and references.
- Wide choice of standard products.

SKF Vibracon can help save costs in:

- Industrial and energy applications
- Marine and offshore applications
- Military and navy applications

SKF Vibracon is typically used for:

- Gas and diesel engines
- Compressors
- Electric motors
- Gearboxes
- Generators
- Pumps and fans
- Bearing housings
- Turbines
- Other critical rotating machinery

SKF Vibracon chocks have been rigorously tested both in the laboratory and the field, in all types of environments and applications under the scrutiny of designers, production managers, OEM commissioning engineers, operators and owners. SKF Vibracon works technically and economically for many of the world's best. Contact SKF for application and trial examination.

Angular soft foot

Bent foot

Angled base

Angular misalignment

Please contact your local SKF Authorised Distributor or SKF sales representative for support, customization or more information about SKF Vibracon.

Carbon steel chocks (-CS)

The SKF Vibracon adjustable chock has many configurations and material options to satisfy technical concerns, the carbon steel models being suitable for indoor use. Additives are added to the mating surfaces providing initial protection before and during installation and avoid seizing of the parts when rotated. The products provide an economic solution for environmentally less demanding applications, while guaranteeing a lifetime reliable chocking.

Surface treated chocks (-CSTR)

Many installations where the SKF Vibracon chocks are applied can be found in tough, humid and salty climates, where protection against corrosion is recommended. To cater for this need, SKF has been testing different solutions resulting in the surface treated SKF Vibracon chock. All parts are treated individually to guarantee an optimal result, consistent quality and extended corrosion protecting capabilities.

Stainless steel chocks (-SS)

In harsh conditions, where requirements cannot be met by carbon steel surface treated chocks, the stainless steel chocks will be the solution. Mating surfaces are treated with additives to avoid seizing of the parts when rotated.

SKF Vibracon

SKF Vibracon low profile

¹⁾ Minimum reduced height can be reached by machining the centre and bottom part of the SKF Vibracon chock on a lathe.

SKF Vibracon low profile (-ASTR)

The low profile elements offer an economic solution for repair projects or fixed design systems where expensive milled chocks, shims or epoxy resins were applied previously. SKF Vibracon low profile configuration addresses those applications where the chock height between the foundation and component has been established by the previous design. Most of the other chocking methods are time-consuming and do not support the life cycle needs of the machine owners and installation activities on a tight schedule.

How to select the appropriate SKF Vibracon chock

The SKF Vibracon app provides a calculation tool to determine the most suitable SKF Vibracon chock for your application.

Technical data

Designation			Bolt size	Tightening torque ¹⁾	Bolt size	Tightening torque ¹⁾	Max. bolt size ²⁾	Machine load ³⁾	Proof load ⁴⁾

¹⁾ Torque values are valid for bolts with metric thread, material grade 8.8, yield strength >640 N/mm², oil lubricated thread courses and nut mating surfaces without slide additives.

²⁾ Optional bolt size. For an engineered solution, please contact vibracon@skf.com.

³⁾ Machine load is the sum of the weight of the component and the dynamic forces on the SKF Vibracon for the heaviest loaded position, multiplied by a safety factor.

⁴⁾ Proof load is the tested load which can be applied on the SKF Vibracon chock at maximum height before plastic deformation will occur. Exceeding the proof load will permanently deform the element, rendering it no longer adjustable. This is a tested load for SKF Vibracon surface treated chocks only.

Other SKF Vibracon applications

The configurations and materials of SKF Vibracon chocks are not limited to the examples shown in the product tables. Many options are available and routinely deployed to solve mounting challenges.

Shock hardened

Elements for the Grade A Shock (MIL-S-901D) requirements.

Extended SKF Vibracon chocks or additional bottom rings

For installations with larger gaps between machine foot and foundation. The maximum extended height should not exceed the diameter of the chock.

Customised chocks

With SKF Vibracon knowledge a solution can be provided for virtually every mounting challenge, even when the bolt pitch is limited or in case of special material requirements.

SKF Vibracon kit for resilient mounts

A one-box kit solution for commonly used resilient mounts.

SKF Vibracon adjustment tools

The use of SKF Vibracon chocks brings efficiency and cost savings to the installation of rotating components. A good set of tools will simplify the installation. The SKF Vibracon adjustment tools are especially designed for safe height alteration of the SKF Vibracon chocks with comfort.
